Tooltips

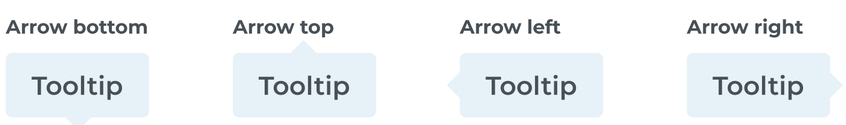
Overview

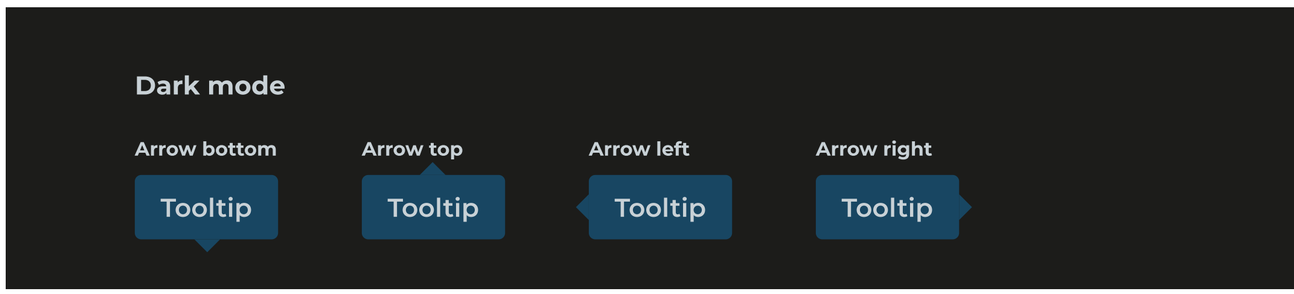
Tooltips are (mainly) used to provide additional information for interactive icons/icon-only buttons. They allow users to understand the function of unfamiliar icons instantly and are thus especially important whenever complex/app-specific icons are used.

When in doubt, provide a tooltip.

While tooltip arrows can point in any direction, the **downwards-pointing arrow is the primary variant** to use. Other variants should be used sparingly. All variants can be accessed via the **info/tooltip** component.

Arrow variants



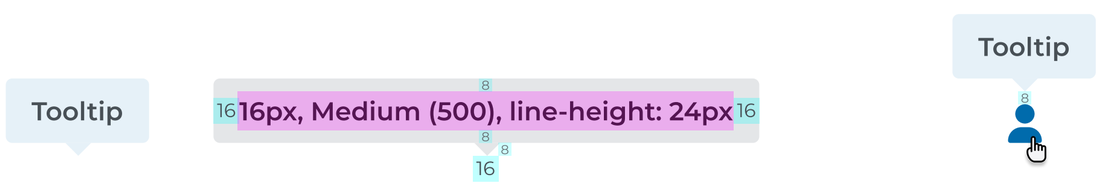


Sizes & construction

Tooltips come in two sizes: Medium and Small. Their width is variable to fit the tooltip text.

Medium

This is the **primary tooltip size.**



Small

Use this size for e.g. action bars with many small icons.
